(54) Title: **MULTIPLE SWITCH SELECTION DEVICE**

(57) Abstract: The present invention describes a multiple switch selection device where the movement of the first member may be very limited such that the overall construction height of the device may be very shallow, whereby the applications where such a multiple switch selection device can be built in, may be widened. Furthermore, it is also an object of the present invention to make the multiple switch selection device more versatile such that a wider range of input may be generated from one single device.
